Introduction

There are some complex steps on stock Ubuntu to complete MOK enrollment while user manual installs dkms packages. So I write this document as a convenient guidance.

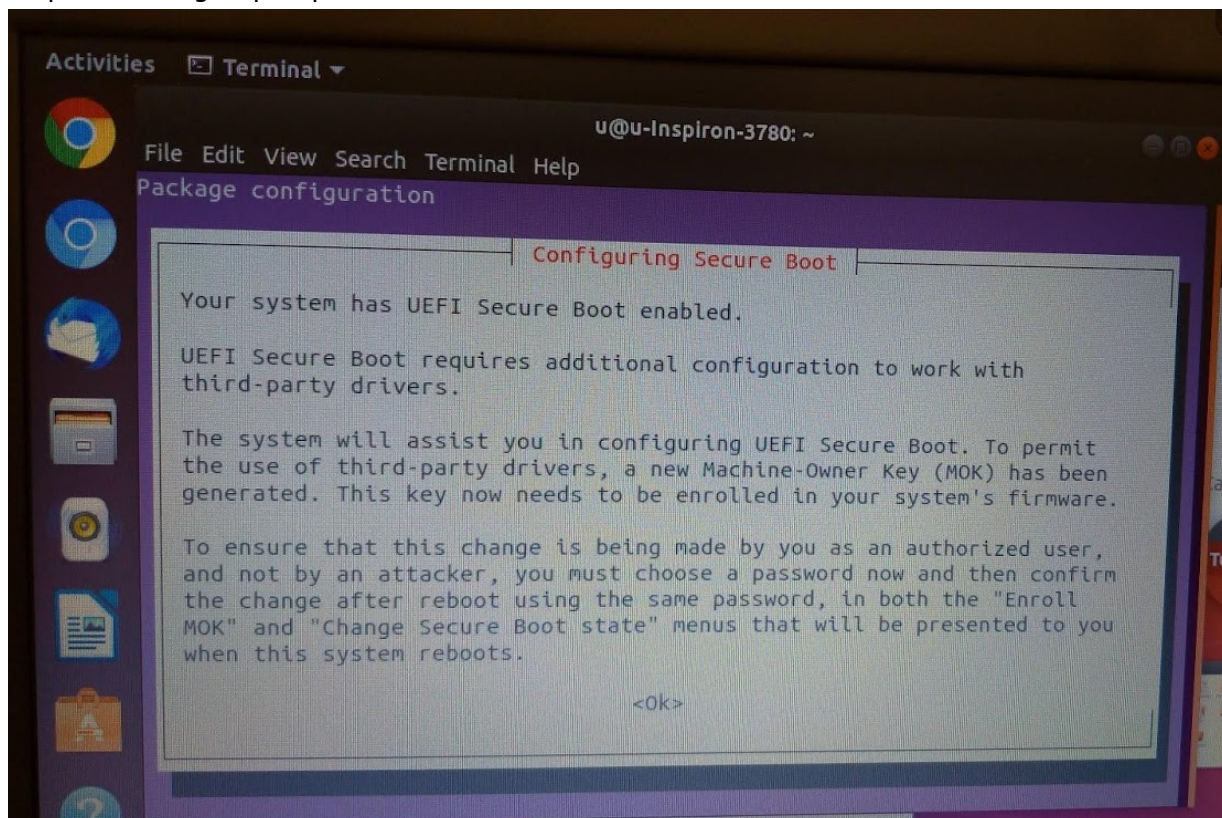

Steps on Stock Ubuntu

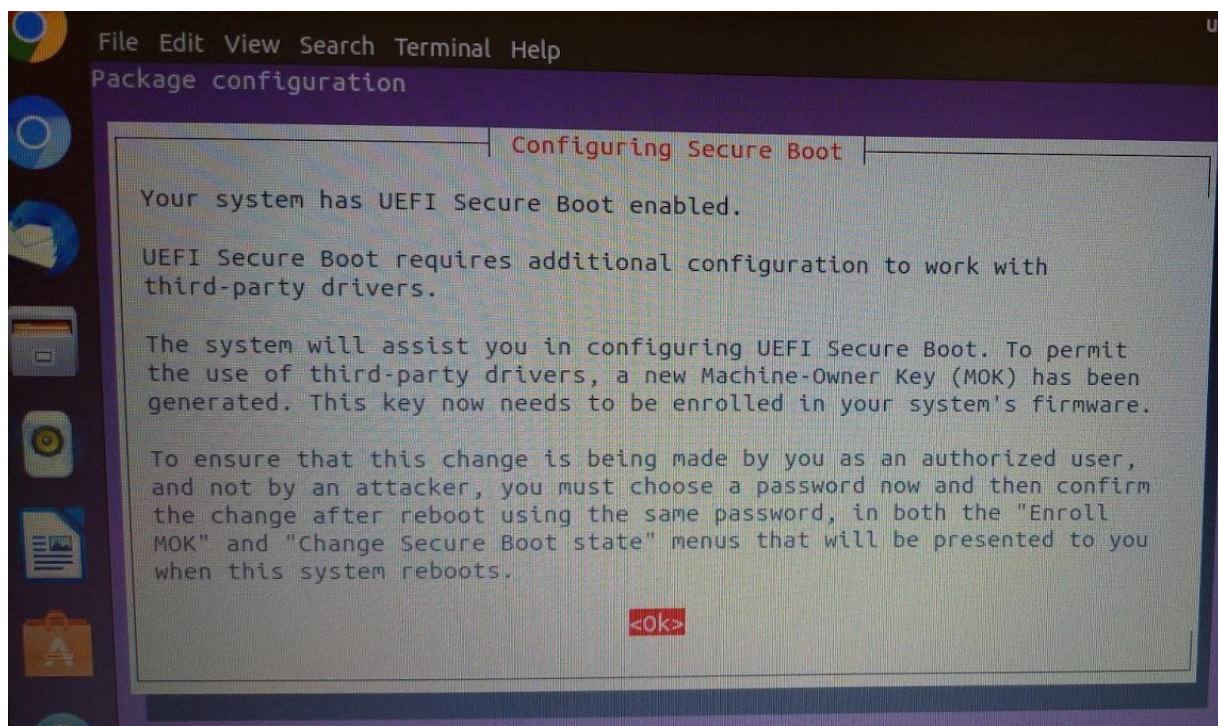

User login and install dkms manually:

Here we take an example of user installing acpi-call-dkms when secureboot be enabled.
Step 1: user installing acpi-call-dkms

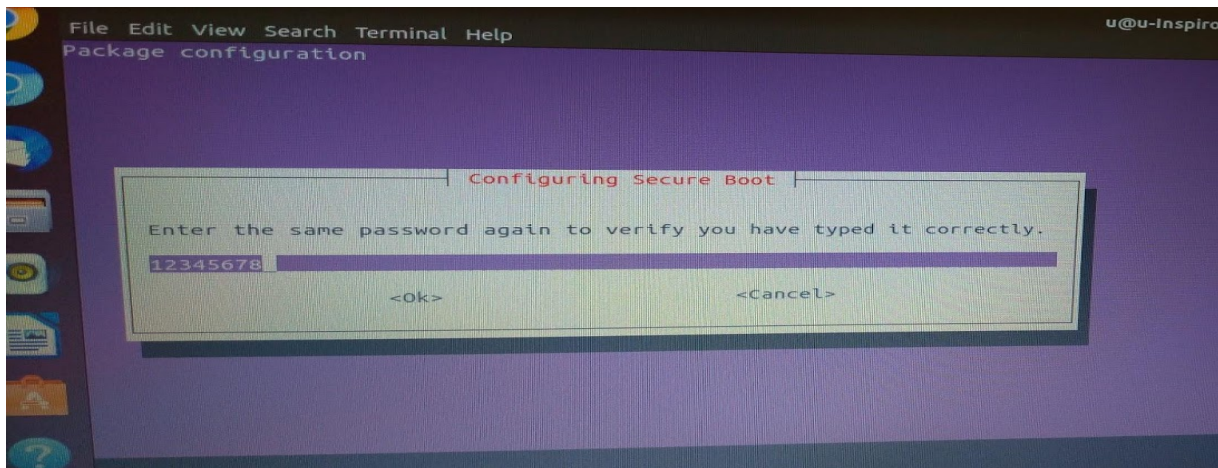

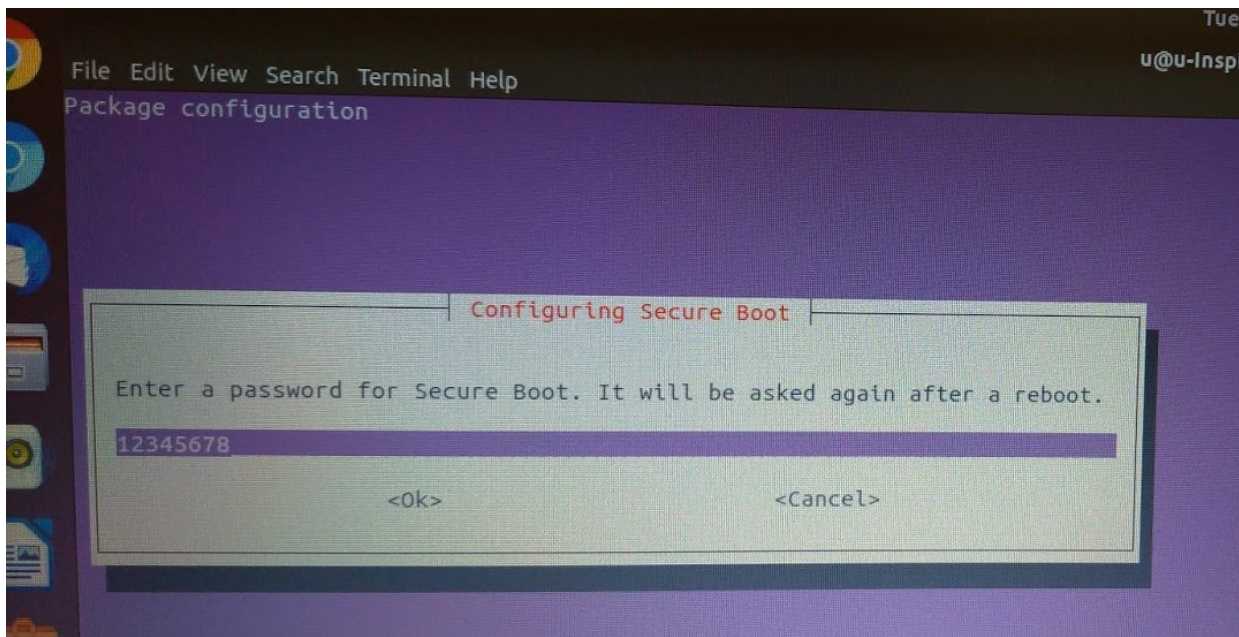

```
u@u-Inspiron-3780:~$ apt-cache search acpi | grep dkms
acpi-call-dkms - Kernel module that enables you to call ACPI methods
bbswitch-dkms - Interface for toggling the power on NVIDIA Optimus video cards
u@u-Inspiron-3780:~$ sudo apt-get install acpi-call-dkms
```

Step 2: user get prompt for mok enrollment

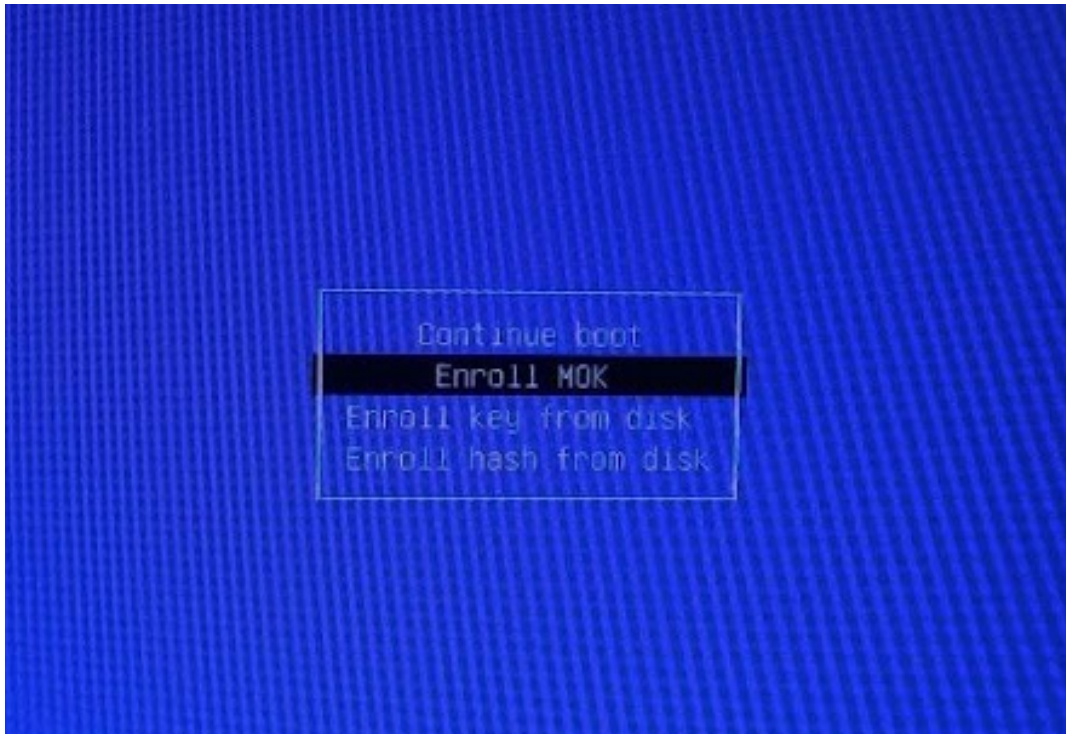

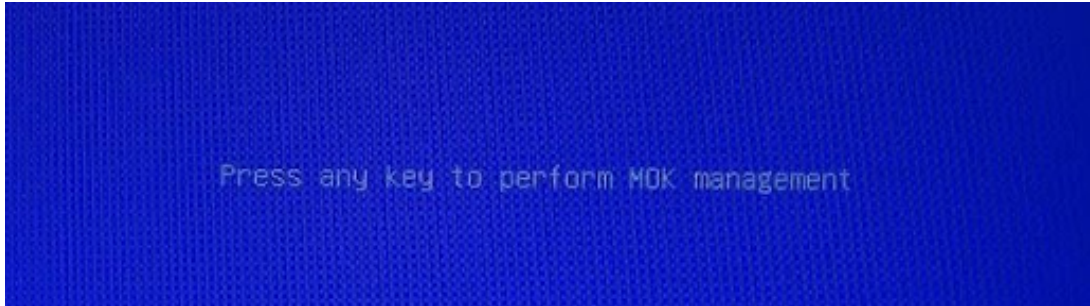

Step 3: The user decides a password phrase. **NOTE: please write down this password, it will be asked again in the next boot in the shim.**

In the next boot:

BIOS will boot into the shim and ask the user to complete the MOK enrollment. **NOTE:**
This screen will be skipped after 6 seconds without operation.

Please enter the password phrase that you inputted in the above step3.
